## 3. INTRODUCTION

### Background to the Problem

- In our daily life sometimes, we need to go outside at late night for emergency work or when we visit any new place for working purpose or visiting, we feel the need of a guide who can help us to know the place or give us security. A female student or worker also wants security when they need to travel at night. Now-a-days it becomes so hard for working parents to take care of their children specially on the daytime. During Covid-19 pandemic we feel the need of delivery small things like official paper, home-made food to relative's house and so many things. By giving security guard who will ensure safety, baby-sitter for alone children or a delivery man who will deliver small domestic products from one place to another can solve those mentioned problem. A school, college, university, company or industry needs the security guard for their safety purpose. We provide the well trained and trusted security guard or security system for them. For example, CC camera, fingerprint door lock etc. To keep it those necessity in our mind we want develop this project that will provide all those services whenever customers request it for.
- The main cause of this problem we could not trusted any person in a single day. That's why we find the honest and experienced people. We provide them the experienced and trusted people also. They did not worry about their security. We provide the best security for them.

We consider this problem just because to insured the safety of the people. And this project will create the opportunity for both customer and employee. The students those need part time job, jobless who need job, female students, all of them can earn money by giving those services to customer. And the general people who are the main customer

will get service like security, baby care at daytime just by sending request using this system. Overall, it will create job sector for jobless and service sector for general people

## Solution to the Problem

- Our Project is concern about to help common people with security especially women and children security. According to report it says daily 13 Females are being raped. The unregistered number is far more. The female Harassment in public places even outside of the school college are very alarming. Eve teasing rate is also high in our country. Our software and the ecosystem will solve this problem. The need for baby siting is increasing rapidly. As women are now working alongside man, they need a person to watch their babies. So, a platform of babysitters will help to fulfil the requirement of them.

Women are half of our population. We cannot neglect them to devolvment of our nation. They are more vulnerable than man. If, women are harassed this way they will lose confident to do work and achieve something. As result families will discourage for women education and work. As result we will lose a capable force from our country. For our system women will feel safe to travel at night be themselves everywhere. As result the economy of our country will increase.

- We want to create a system which will provide on demand security services. Under this system there will be enough employees in both gender who will be ready for giving services whenever customers will request.

As employees, there will work students, recently graduates who are searching for job and any candidate who can full-fill the job requirements. So, this system will target our job market by giving jobless' work opportunity.

- The main audience would be general people. They will be able to request for services like security, baby-sitting, delivery home made products through this system whenever they are on need. We belief that the existing software is the solutions for the customer and employee also.

## 4. REQUEIREMNT SPECIFICATION

### 4.1 System Features

#### 1) System Registration

Functional Requirements

- i) The software must allow users to register with the necessary information.

- ii) If the username is not unique, the system will prompt the user to try registration with a different username again.

Priority Level: High

Precondition: Not applicable.

## **2) System Login**

Functional Requirements

- i) Users must be able to log in using their assigned username and password.
- ii) If the username and/or password have been entered incorrectly more than three times, the random verification code will be generated by the system to retry login.

Priority Level: High

Precondition: The user must have a valid user ID and password.

## **3) System Verification**

Functional Requirements

- i) Users will give the valid phone number for validation the website account.

Priority Level: High

Precondition: User must have valid phone number.

## **4) Home page**

Functional Requirements

- i) Users will find or search for services.
- ii) To see profile.
- iii) Check employee details.

Priority Level: Medium

Precondition: User must have valid account

## **5) Check Profile**

Functional Requirements

- i) User can see his profile
- ii) Change profile
- iii) Edit profile

Priority Level: Medium

Precondition: User must have valid account

## **6) Job Circular**

Functional Requirements

- i) User can see the job circular
- ii) Job details
- iii) Job location

Priority Level: Medium

Precondition: User must have valid account

## **7) Apply for Job**

Functional Requirements

- i) User can apply for job
- ii) User needs to full-fill all the condition

Priority Level: Medium

Precondition: User must have valid account

## **8) Payment**

Functional Requirements

- i) User can payment their charges through the software. Three ways to get payment  
Online Banking (Bkash/ Nagad/Rocket/Upay)
- ii) Banking (Any Card)
- iii) Cash on payment.

Priority Level: Medium

Priority Level: High

Precondition: user have valid user id and password.

## 4.2 System Quality Attributes

1. Usability: The system must be user-friendly. The system should be intuitive and simple to navigate.
2. Efficiency: The system should maximize the capacity and memory of the processor. Any task should be completed with optimal efficiency.
3. Security: System security should be sufficient to prevent unauthorized access to system functions in order to prevent information loss, protect data privacy, and safeguard the system against viruses.
4. Modularity: The system's every block of code must be under separate and acceptable modules.
5. Testability: The system should be simple to test and identify flaws.
6. Flexibility: The system should be flexible enough to be modified.
7. Reusability: Code library classes should be general enough to be utilized on multiple versions of an application or new projects.

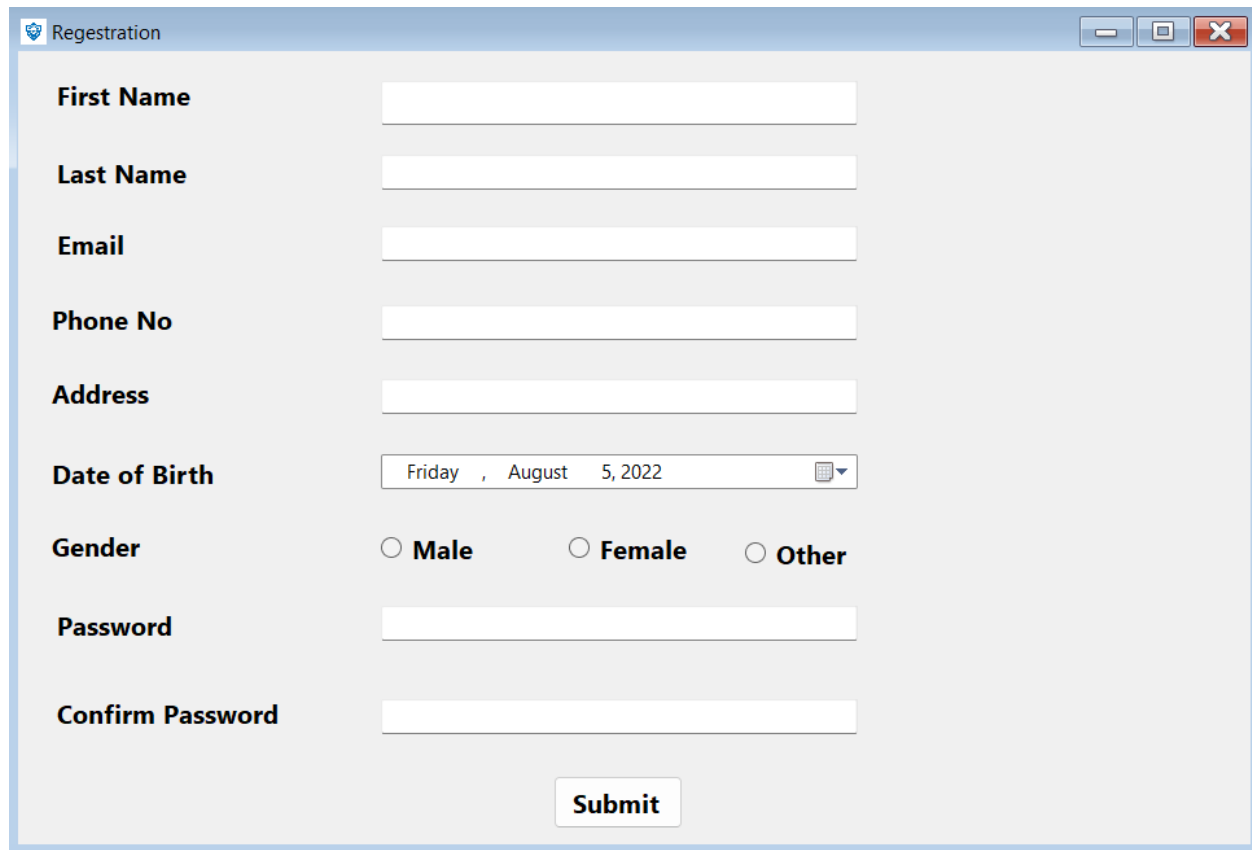

## 4.3 System Interface

The system interface of a mobile financial service would typically include a number of features and tools that allow users to access and manage their financial accounts and transactions on their mobile devices. Here are system interface elements that a mobile financial service includes:

### 4.3.1 User Interface and Experience (UI/UX):

#### 4.3.1.1 A registration screen where users can enter their information to create their accounts.

A screenshot of a web browser window titled "Registration". The window contains a registration form with the following fields: "First Name", "Last Name", "Email", "Phone No", "Address", "Date of Birth" (with a date picker showing "Friday, August 5, 2022"), "Gender" (with radio buttons for "Male", "Female", and "Other"), "Password", and "Confirm Password". A "Submit" button is located at the bottom center of the form. The window has standard minimize, maximize, and close buttons in the top right corner.

Registration

First Name

\*Password

FIG 4.3.1.1: Registration page

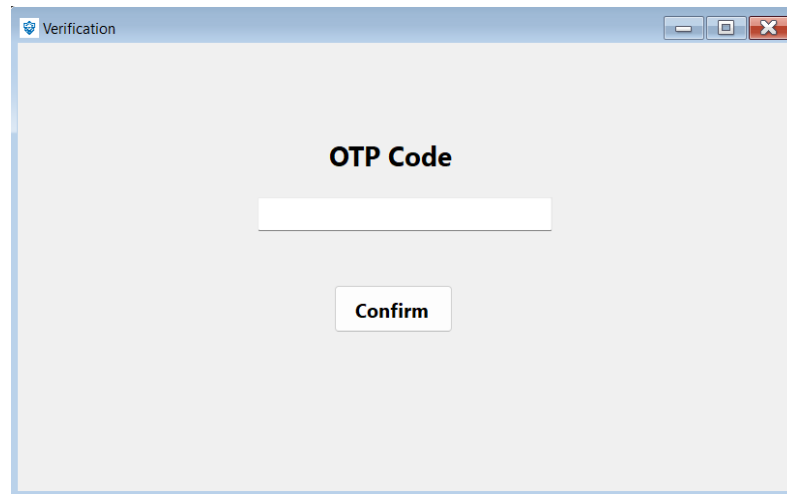

**4.3.1.2 A login screen where users can enter their credentials to access their accounts. This could include features such as multi-factor authentication for added security.**

The screenshot shows a web browser window titled "Log In". The page features a blue shield logo with a hexagonal pattern inside a dashed rectangular box. Below the logo, the text "On Demand Security System" is displayed in a bold, black font. Underneath, there are two input fields: "UserName" and "Password". Below the "Password" field, there are three buttons: "Sign Up", "Log In", and "Forgot Pass".

**FIG 4.3.1.2: Login Page**

**4.3.1.3 Verification Account by SMS sending Code.**

The screenshot shows a web browser window titled "Verification". The page has a light gray background. In the center, the text "OTP Code" is displayed in a bold, black font. Below this text is a single-line input field. At the bottom of the page, there is a button labeled "Confirm".

**FIG 4.3.1.3: Verification Page**

#### 4.3.1.4 Home page For Services.

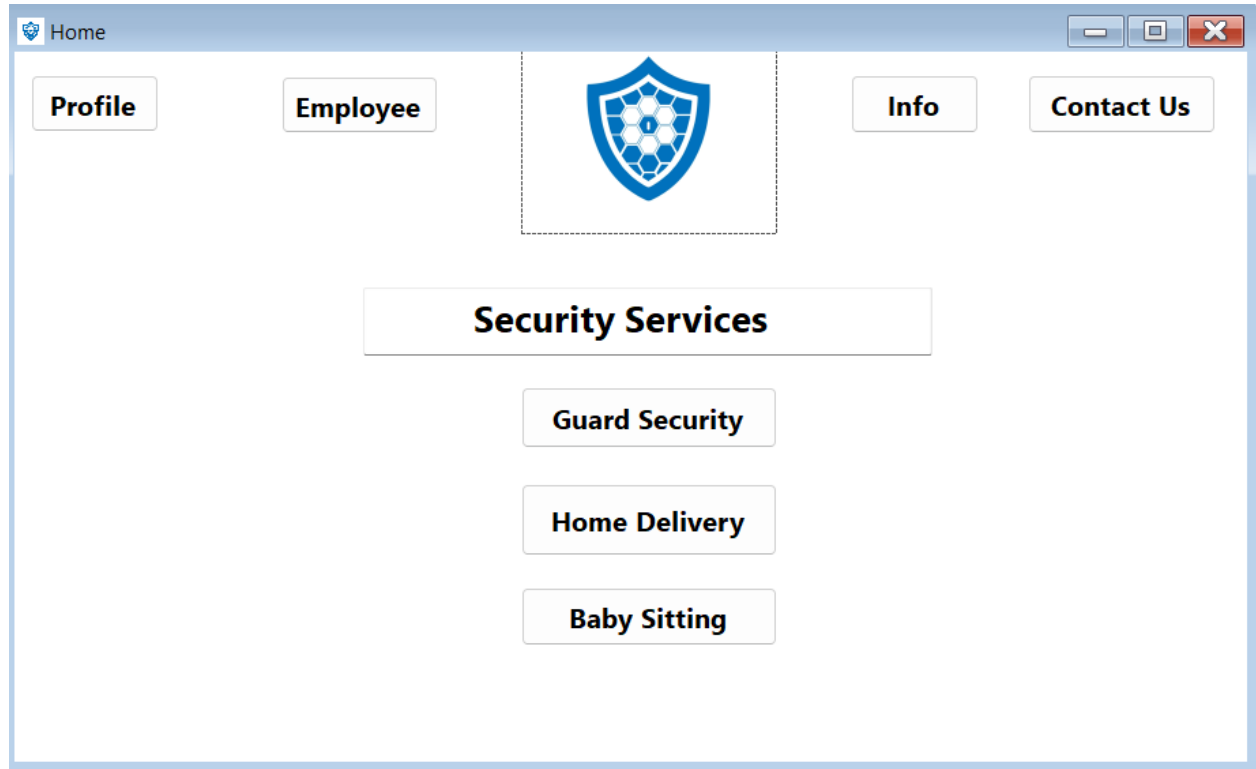

FIG 4.3.1.4 Home page

#### 4.3.1.5 User can see his/her profile.

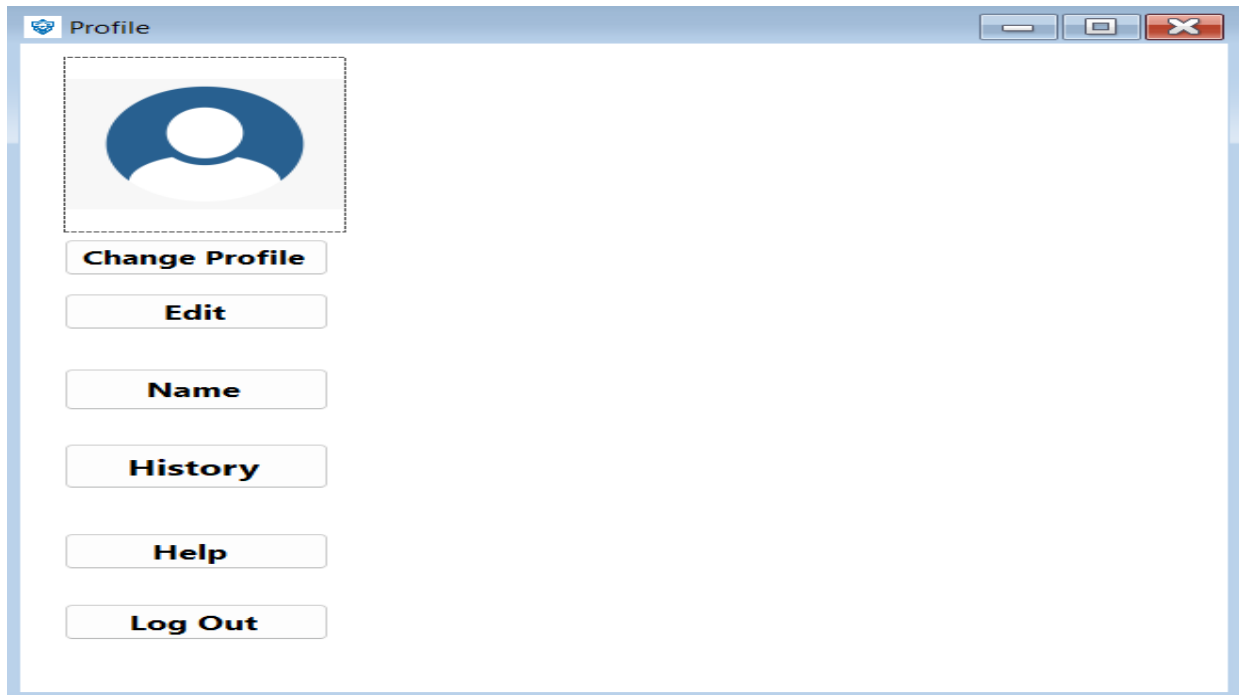

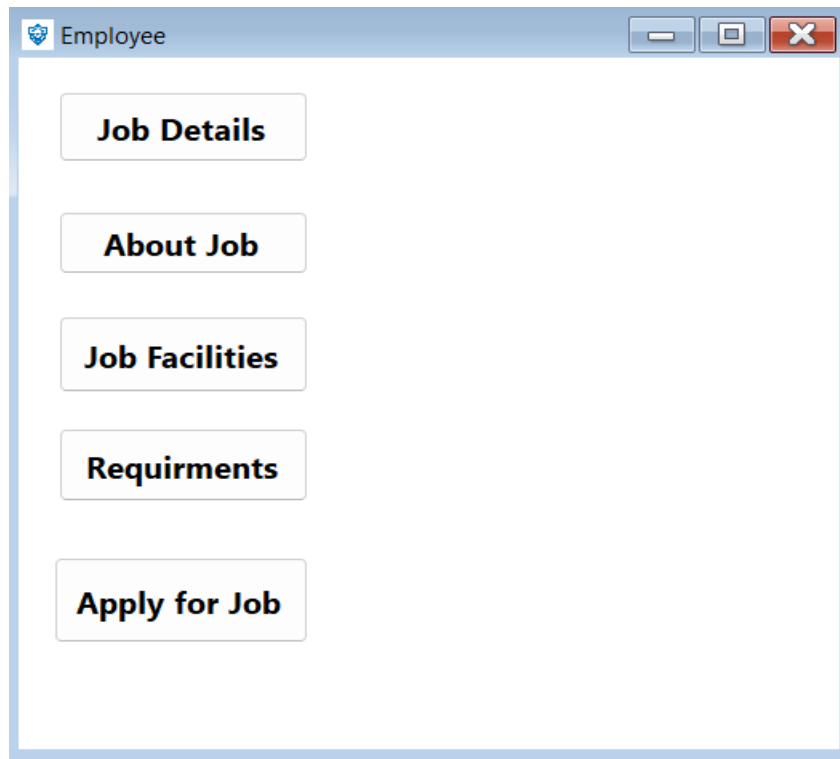

FIG 4.3.1.5 Profile

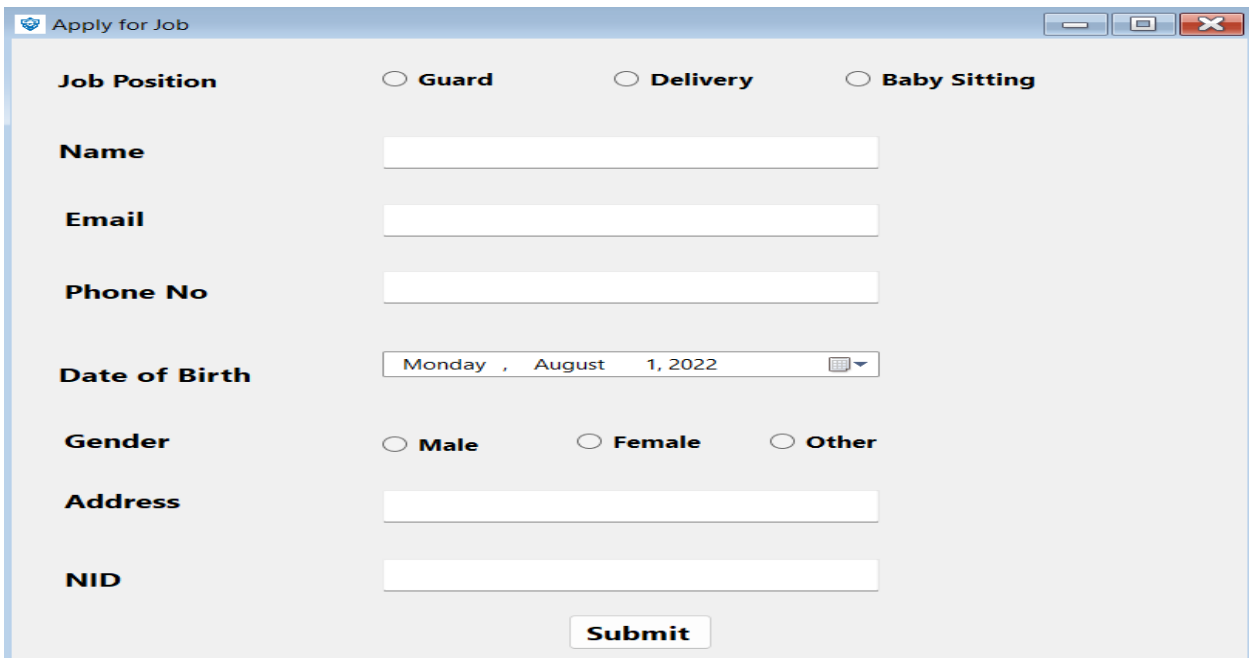

#### 4.3.1.6 User can see the job circular.

The screenshot shows a window titled "Employee" with a standard Windows-style title bar (minimize, maximize, close buttons). Inside the window, there is a vertical stack of five buttons: "Job Details", "About Job", "Job Facilities", "Requirments", and "Apply for Job".

FIG 4.3.1.6: Employee

#### 4.3.1.7 Apply for job.

The screenshot shows a window titled "Apply for Job" with a standard Windows-style title bar. The form inside contains the following fields and options:

- Job Position:** Three radio button options: ☐ Guard, ☐ Delivery, and ☐ Baby Sitting.
- Name:** A text input field.
- Email:** A text input field.
- Phone No:** A text input field.
- Date of Birth:** A date picker showing "Monday , August 1, 2022".
- Gender:** Three radio button options: ☐ Male, ☐ Female, and ☐ Other.
- Address:** A text input field.
- NID:** A text input field.
- Submit:** A button at the bottom center of the form.

FIG 4.3.1.7: Apply for job

#### 4.3.1.8 Payment:

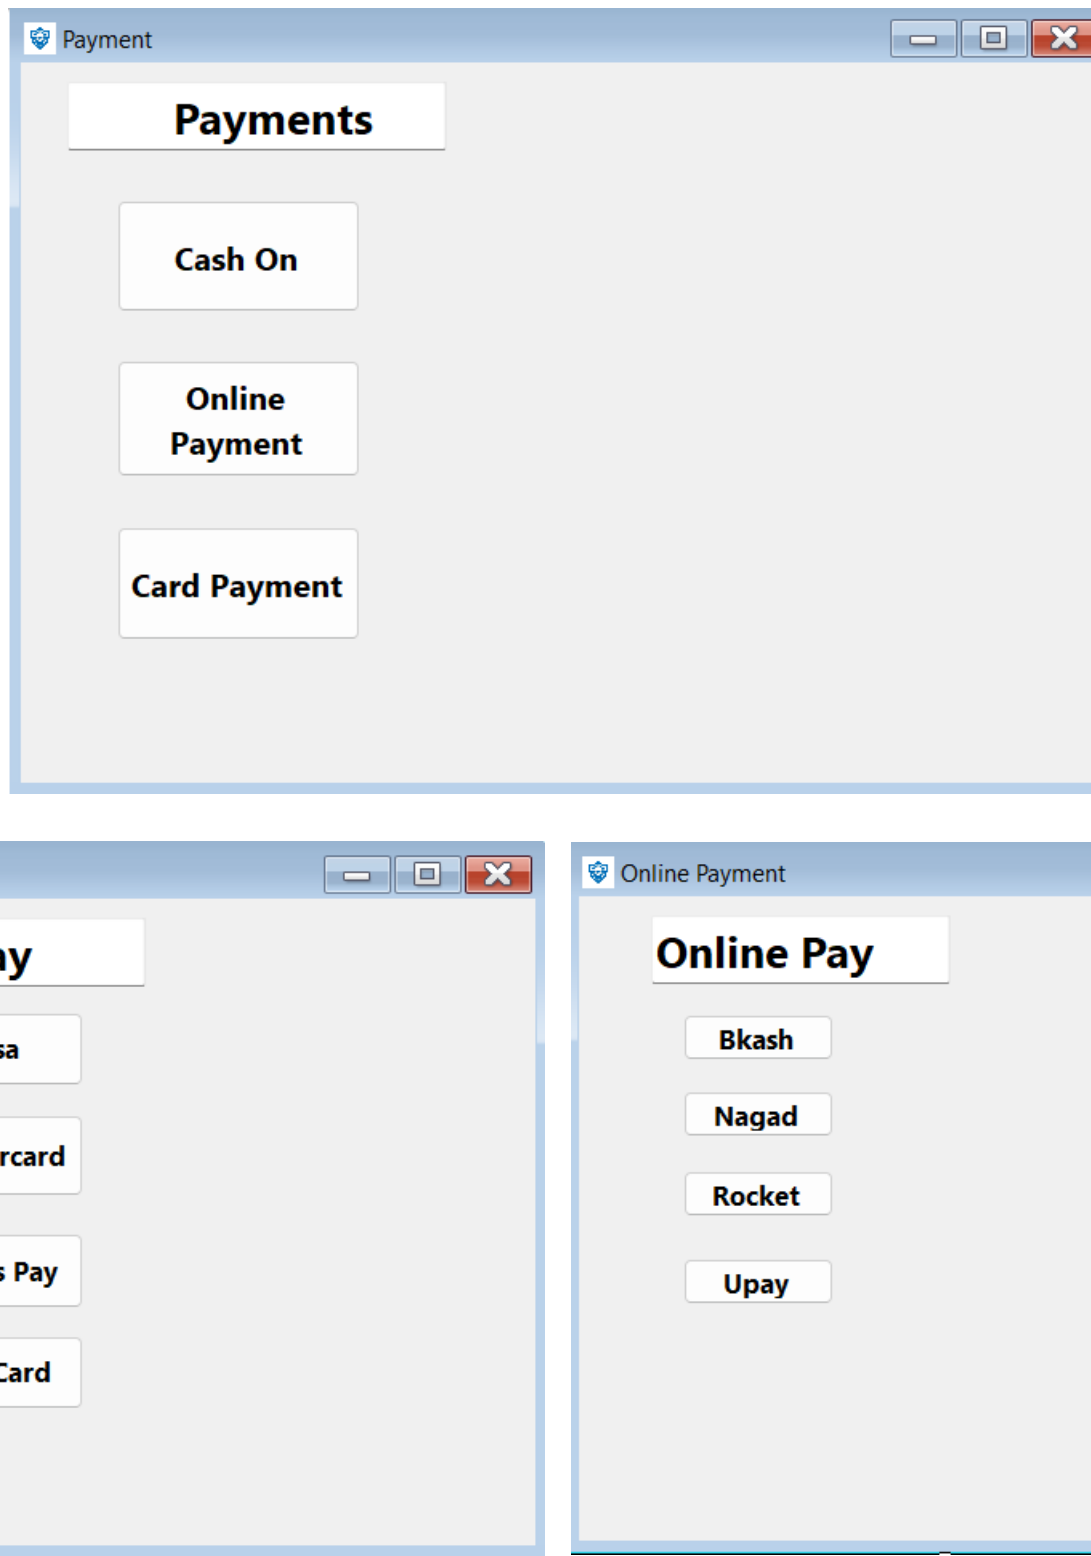

FIG 4.3.1.8: Payment

#### 4.4 Project Requirements

Since the model chosen for completion of the project is agile method, by taking effort estimation in account it was found that 130 working days is required to complete the project. On the basis of Rational Unified Process, the time phase for each task can be divided as follows:

| <b>Task of phase</b>        | <b>Days</b> |
|-----------------------------|-------------|
| Requirements Elicitation    | 21          |
| Project Planning            | 18          |
| Requirements Analysis       | 14          |
| System Design               | 28          |
| Implementation & Unit Test  | 37          |
| System Integration & System | 21          |
| Testing                     | 15          |

**Note:** Every engineer works 8 hours a day, 6 days a week. The overall length of the project is 154 working days, (excluding national holidays).

#### Cost and Profit Analysis

##### Estimation Cost:

Estimation as per the basic COCOMO'81 the software is semi-detached type. The estimation formula for Embedded software:

Coefficient,  $C = 3.0$

Complexity,  $P = 1.12$

Dependent constraint  $T = 0.35$

Assume that the size of an organic type software product has been estimated to be 5,000 lines of source code.

Source line of code = 5,000

Effort =  $3.0 * (5000/1000)^{1.12}$

= ~ 18 p/m

Development Time =  $2.50 * (18)^{0.35}$

= 7 months

Project development time = 7 months

Estimated Budget:

Working days = 6 days in a week

Working hours per day = 8 hours

Working hours in 7 month= $(7*48*24)= 8064$  hours

### Requirement Cost:

Business analysis salary per month= 150,000 per/month

Salary per day= $(150000/24)=\sim 6250$  TK

| Work Type                                   | Cost (TK)                   |
|---|-----------------------------|
| Collect data from stakeholder (6 Days)      | $6*6800=37500$              |
| Communicate with user group(8Days)          | $8*6800=50000$              |
| Analysist functional requirement(4Days)     | $4*6800=25000$              |
| Analysist non-functional requirement(3Days) | $3*6800=18750$              |
|   | <b>Total cost=131250 Tk</b> |

### Project Manager Cost:

Project manager salary per month= 110000 Tk

Salary per day= $(110000/24)=\sim 4500$  TK

| Work Type                            | Cost (TK)           |
|--------------------------------------|---------------------|
| Project planning (12 Days)           | $12*4500=5400$      |
| Management Team (2 Days)             | $2*4500=9000$       |
| Work distribution (4 Days)           | $4*4500=18000$      |
| Unfamiliar method identify (14 Days) | $14*4500=63000$     |
|                                      | <b>Total=144000</b> |

**Design Cost:**

Designer salary=50000 Tk per month

Salary per day=(50000/24)=~2000 TK

| Work Type                   | Cost (TK)                |
|-----------------------------|--------------------------|
| Whole project design(8Days) | 8*2000=16000             |
| Website Design(8Days)       | 8*2000=16000             |
| Mobile App design(6Days)    | 6*2000=12000             |
| Database design(6Days)      | 6*2000=12000             |
|                             | <b>Total cost= 56000</b> |

**Development Cost:**

Developer salary=80000 tk per month

Salary per day=(80000/24)=~3300 TK

| Work Type                            | Cost (TK)           |
|--------------------------------------|---------------------|
| System Integration & System (21Days) | 21*3300=69300       |
| Unit Testing(12 Days)                | 12*3300=39600       |
| Coding(25Days)                       | 25*3300=82500       |
|                                      | <b>Total=191400</b> |

**Testing Cost:**

Tester salary =40000 per/month

Salary per day=(40000/24)=~1600 TK

Total cost=15\*1600= 24000 tk

**Maintenance Cost:**

Monthly 10 Hours (7 months and per hour salary 1000) Cost=10 x 7 x 1000=70,000 tk

**Total Cost:**

|                      |        |
|----------------------|--------|
| Requirement Cost     | 131250 |
| Project Manager Cost | 144000 |
| Design Cost          | 56000  |
| Development Cost     | 191400 |
| Testing Cost         | 24000  |

|                      |                |
|----------------------|----------------|
| Maintenance Cost     | 70000          |
| Website hosting Cost | 40000          |
| Marketing cost       | 120000         |
| Training Cost        | 130000         |
| Office cost          | 150000         |
| Utilities Cost       | 60000          |
| <b>Total</b>         | <b>=986650</b> |

### Estimation Profit:

Those who will use our service they have to pay some amount of money. An additional 8% of the employee's salary will be charged to customer who use our service. And additional 5% of the employee's salary will be charged to employee. For example, a employee's salary is 20000 tk. Then profit from customer= $20000 \times 8\% = 1600$ tk and profit from employee= $20000 \times 5\% = 1000$ tk. Hear, total profit= $1600 + 1000 = 2600$  from 1 employee per month. If 100 employee work in 1 month then profit= $2600 \times 100 = 260000$ . After 4 month we will be benefited ( $4 \times 260000 = 1040000 - 986650$ )= $53350$ . After that our profit  $8\% + 5\% = 13\%$  every month

## 5. FEATURES NOT TO BE TESTED

The following is a list of the areas that will not be specifically addressed. All testing in these areas will be indirect as a result of other testing efforts. For example:

There are a few potential features that might not be tested in a mobile financial service app, depending on the specific requirements and constraints of the project:

**Hardware compatibility:** If the website is only designed to run on specific types of hardware, such as smartphones or tablets, then the development team may not need to test the website on other types of hardware.

**Operating system compatibility:** If the website is only designed to run on specific operating systems, such as Mac OS or Windows, then the development team may not need to test the website on other operating systems.

**Third-party integrations:** If the website does not integrate with any third-party systems or services, then the development team may not need to test these integrations.

Edge cases: If the app is not expected to encounter certain scenarios or conditions, such as network disruptions or power outages, then the development team may not need to test for these scenarios.

Overall, the features that are not tested will depend on the specific requirements and constraints of the project, as well as the priorities and goals of the development team and stakeholders.

## 6. TESTING APPROACH

### 6.1 Testing Levels

There are several levels of testing that are to be performed on a mobile financial service app, including domain testing, unit testing, integration testing, and acceptance testing. These levels can be grouped into three main categories:

**Domain testing:** This is a type of testing that focuses on the specific domain or context of the website, such as the financial industry. Domain tests are typically created and executed by subject matter experts or domain specialists, and they are used to verify that the website is aligned with industry standards and regulations, as well as user expectations and needs.

**Unit testing:** This is a type of testing that focuses on individual components or units of the website, such as functions or modules. Unit tests are typically created and executed by the development team, and they are used to verify that each unit of the website is functioning correctly and meeting the specified requirements.

**Integration testing:** This is a type of testing that focuses on the integration of different units or components of the website. Integration tests are typically created and executed by the development team, and they are used to verify that the different units of the website are working together correctly and meeting the specified requirements.

**Acceptance testing:** This is a type of testing that focuses on verifying that the website meets the specified requirements and is ready for release. Acceptance tests are typically created and executed by the development team or an independent testing team, and they are used to verify that the website is functioning correctly and meeting the specified requirements.

### 6.2 Test Tools

To test a mobile financial service using Selenium, the following steps have been taken:

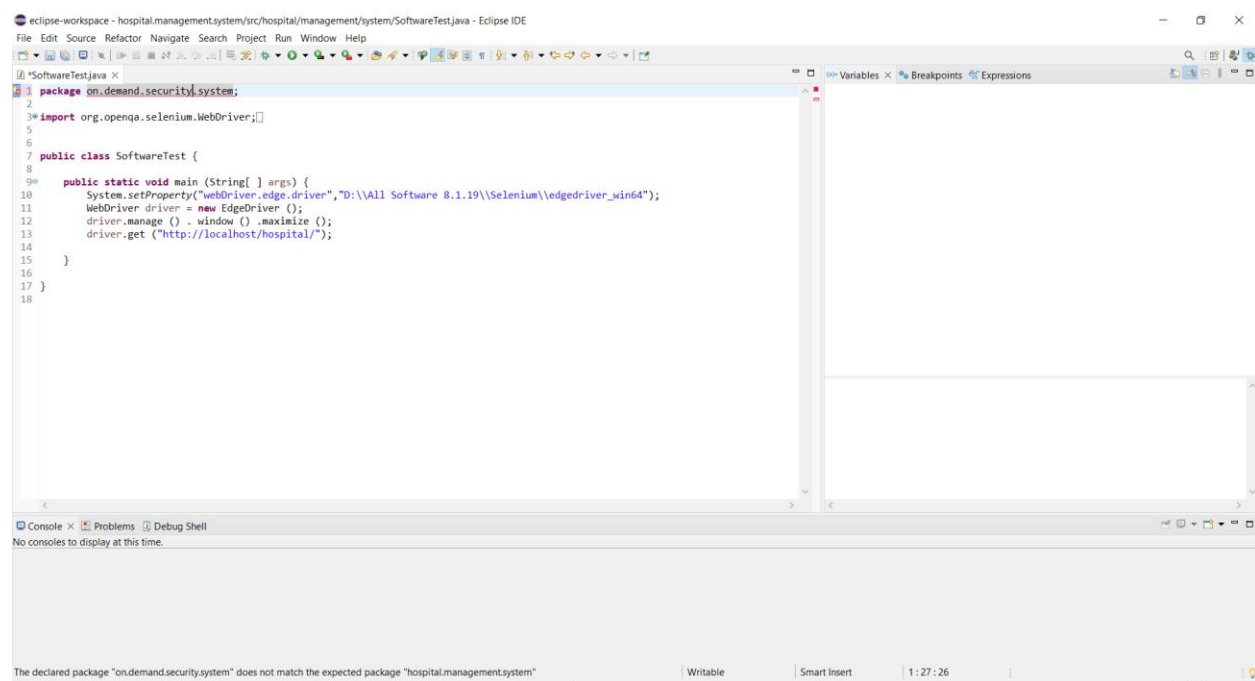

1. **Install and configure Selenium:** The Selenium software have been downloaded and installed, as well as any necessary dependencies, such as a web driver for controlling the browser. The installation instructions provided by Selenium would have been followed, or other technical experts have been consulted for assistance if needed.

2. Write the test scripts: The test scripts that should be executed by Selenium would have been written. These scripts have been written in programming language Java, and they have defined the specific actions and checks that Selenium should perform. The scripts could have included steps for logging in to the service, checking account balances, and performing transactions.

3. Execute the test scripts: The test scripts have been run using Selenium, which would have automatically performed the actions and checks defined in the scripts. Selenium have provided feedback on the results of the tests, such as any errors or failures that occurred. The Selenium command-line interface or graphical user interface would have been used to execute the scripts, or a continuous integration tool could have been used to automate the testing process.

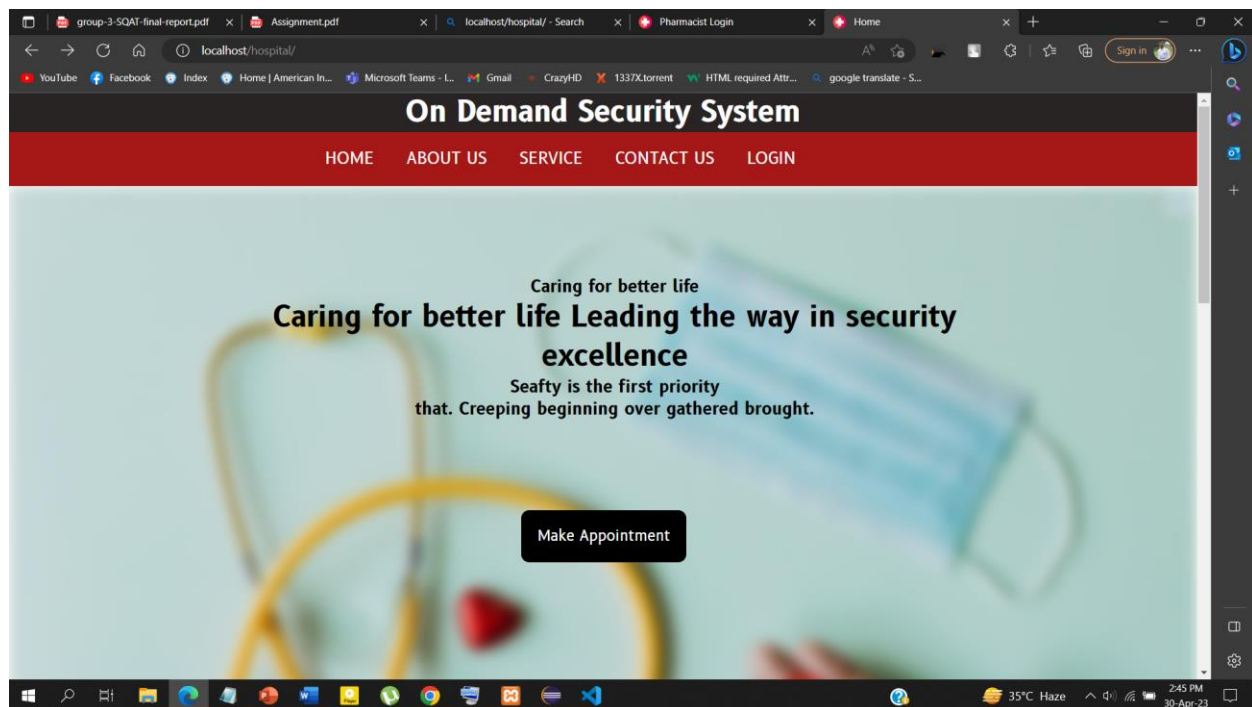

4. Analyze the test results: The test results have been reviewed and any issues or bugs that were discovered during testing would have been identified. The Selenium output, such as any error messages or failed test cases, have been examined and the root cause of the issue would have been determined. The development team have been worked with to fix any issues and ensure that the mobile financial service is functioning correctly.

## 4.1 Write some code in Selenium for testing

**FIG 4.1: Selenium Code**

## 4.2 Test result.

**FIG 4.2: Result**

## 6.3 Meetings

The test team will meet once in every week to evaluate progress to date and to identify error trends and problems as early as possible. The test team leader will meet with development and

the project manager once every two weeks as well. These two meetings will be scheduled on different weeks. Additional meetings can be called as required for emergency situations.

## 7. TEST CASES/TEST ITEMS

### Test Automation:

|   |                  |  |                      |               |
|---|------------------|--|----------------------|---------------|
| <b>Project Name:</b> One demand security System                   |                  | <b>Test Design By:</b><br>Jahid Hassan   |                      |               |

## 8. ITEM PASS/FAIL CRITERIA

The pass/fail criteria for a test item in a on demand security system service website are the specific criteria or standards that must be met in order for the test item to be considered successful or pass. These criteria may be based on the requirements and specifications of the website, as well as any industry standards or best practices that apply.

Pass/fail criteria for test items in a on demand security system service website are:

**Account management:** The test item must display the user's account balances and transaction history correctly, and it must allow the user to update their personal information easily and securely.

**Bill payment:** The test item must display the user's payees and payment details correctly, and it must allow the user to make payments easily and securely.

**Money transfer:** The test item must display the user's transfer history and transaction details correctly, and it must allow the user to transfer money easily and securely.

Overall, the pass/fail criteria for a test item will depend on the specific requirements and constraints of the project, as well as the priorities and goals of the development team and stakeholders.

## 9. TEST DELIVERABLES

Test deliverables are the outputs or results of the testing process that are delivered to the stakeholders or project team. These deliverables may include documents, reports, logs, and other artifacts that provide information about the testing process and the results.

Test deliverables for a on demand security system service website are:

**Acceptance test plan:** A document that outlines the scope, objectives, and approach of the acceptance testing process, as well as the roles and responsibilities of the testing team.

**System/Integration test plan:** A document that outlines the scope, objectives, and approach of the system and integration testing process, as well as the roles and responsibilities of the testing team.

**Unit test plans/turnover documentation:** A document or set of documents that describe the specific unit tests that will be performed on the website, including the test steps, expected results, and pass/fail criteria.

**Screen prototypes:** A set of screen mock-ups or prototypes that show how the website will look and function, including the layout, design, and user interactions.

**Report mock-ups:** A set of mock-ups or examples of the reports that will be generated by the website, such as account balances, transaction history, and bill payments.

**Defect/Incident reports and summaries:** A document or set of documents that describe any defects or issues that were identified during the testing process, including the symptoms, causes, and resolution steps.

**Test logs and turnover reports:** A document or set of documents that record the details of each test that is performed, including the test steps, actual results, and any notes or comments. These logs may also include turnover reports that summarize the results of the testing process and provide recommendations for next steps.

Overall, these deliverables provide valuable information and insights about the testing process and results for a mobile financial service app, and they can be used to identify any defects or issues in the website, as well as to improve the quality and functionality of the website.

## 10. STAFFING AND TRAINING NEEDS

The staffing and training needs for a on demand security system service website will depend on the specific requirements and constraints of the project, as well as the priorities and goals of the development team and stakeholders. However, in general, a on demand security system service website may require the following staffing and training needs:

**Project manager:** A person who is responsible for overseeing the development and testing of the website, including managing the budget, schedule, and resources, as well as communicating with the stakeholders and project team.

**Development team:** A group of people who are responsible for designing, coding, and testing the website, including the front-end user interface, the back-end data and logic, and the integration with other systems and services.

**Testing team:** A group of people who are responsible for creating and executing the test cases, as well as identifying and reporting any defects or issues in the website.

**Training team:** A group of people who are responsible for providing training and support to the users of the website, including creating and delivering training materials, as well as providing ongoing support and assistance.

## 11. RESPONSIBILITIES

13. PLANNING RISKS AND CONTINGENCIES

Risks and contingencies are potential problems or challenges that may arise during the development and testing of a on demand security system service website. Planning for these risks and contingencies is an important part of the project management process, as it can help to mitigate or avoid the risks, and to ensure a successful and smooth development and deployment of the website.

Here are risks and contingencies that may be considered in the planning process for a on demand security system service website:

**Technical risks:** These risks may include issues with the website technology or architecture, such as compatibility problems with the operating system or hardware, performance bottlenecks, or security vulnerabilities.

**Regulatory risks:** These risks may include compliance issues with industry standards or regulations, such as data privacy, data security, and anti-money laundering laws.

**Market risks:** These risks may include changes in the market conditions or the competitive landscape, such as new competitors, changes in consumer behavior or preferences, or shifts in the regulatory environment.

**Resource risks:** These risks may include constraints or shortages of resources, such as budget, personnel, or time, that may impact the development and testing of the website.
